RESEARCH INTERESTS

The most recent research interest is focused on studying the cellular mechanisms underlying metabolic pathways related to the growth of the insect *Hermetia illucens*, commonly known as Black Soldier Fly (BSF), that represents a sustainable alternative for food waste valorisation. The aim of this research topic is understanding the complex processes of BSF development, together with the evaluation of the application potential of larval biomass as an alternative and sustainable source of nutrients and bioactive molecules with relevant antioxidant and cytoprotective properties that can be used as natural ingredient in biomedical and environmental applications. Past and current research interests also include:

- *In vitro* and *in vivo* evaluation of protein hydrolysates obtained from by-products of industrial processing as valuable nutraceutical in food, feed and pharmaceutical industry with particular interest in the perspective of waste valorization.
- Physiological and molecular responses of marine organisms to several environmental constraints. Specific research interests and past projects include studies on marine ecosystem biomonitoring, effects of chemicals and heavy metals on gene and protein expression, evaluation of oxidative stress biomarkers, DNA damage, relationships between DNA modification (methylation) and fitness-related parameters (growth, survival, development) in fish and mussels.
- Characterization of molecular response to oxygen availability in marine invertebrate involving transcription factors as key players in the strategies to cope with the hypoxia, a rising feature in aquatic ecosystems.
- Evaluation of the effects of metal nanoparticles, microplastics and emerging contaminants on aquatic organisms.
- microRNAs and epigenetic regulation of the oxidative stress and innate immune response gene networks by environmental factors, such as photoperiod in commercially important species.
